

## Waterrower water pump

Waterrower water pump - for easy filling and emptying of the Waterrower tank. With a flexible end and water stop function.

**CHF 14.90**

### Product details:

- Easy to fill
- Water stop function

The heart of the WaterRower is the patented water tank with the ergonomically shaped water paddle. This enables maximum water intake and creates even, smooth resistance. Training with water resistance is absolutely easy on the joints, relaxing and at the same time extremely effective.

The original WaterRower was designed by John Duke in 1988 and is characterized by its practical function and timeless design. The footrests are highly flexible and can be easily adjusted, the rolling seat moves almost silently along the rails during training - after the workout, the WaterRower can be conveniently placed upright against the wall with the help of two rollers.

Rowing ergometers with water resistance such as the WaterRower are always remarkably quiet and particularly effective, even under extreme load. At the same time, the training is gentle and beneficial - for young and old.
